EDUCATION

College of Staten Island, City University of New York | B.S. in Computer Science **Expected 2028**

Relevant coursework: Data Structures, Database Systems, Computer Networking, Web Development, Programming Languages, Discrete Mathematics

TECHNICAL SKILLS

Languages: Python, JavaScript, C++, SQL, HTML, CSS

Web & APIs: React, Bootstrap 5, REST APIs, Postman (collections, environments), GitHub Pages, Netlify

Databases & Backend: MySQL, FastAPI, SQLAlchemy (async), relational schemas, joins, aggregation, subqueries

Tools & Testing: Git, GitHub, GitHub Actions (CI), Husky, VS Code, Jupyter Notebook, pytest, Vitest, jsdom, mocking

EXPERIENCE

Peer Mentor | Computer Science Department, College of Staten Island **09/2026 – Present**

- Co-maintain the **CS Internship Handbook**, the department's GitHub-backed GitBook site used by every CS student, turning department requirements into new and revised pages on resumes, LinkedIn, GitHub, certifications, and internships.
- Commit changes to the handbook's GitHub repo, review pull requests, deploy approved updates, and fix live-site errors.
- Review resumes and co-host resume and LinkedIn workshops for 30+ computer science students, coaching them on how to present their projects and technical skills.

PROJECTS

Developer Portfolio Live site | Source code **02/2026 – Present**

- Built a responsive portfolio site in HTML, CSS, and JavaScript, deployed on GitHub Pages.
- Set up 16 Vitest and jsdom unit tests for the copy-email feature (Clipboard API and fallback) and site integrity (broken links, missing assets, alt text, one-page resume).
- Automated them with a Husky pre-commit hook that blocks failing commits and a GitHub Actions CI pipeline that runs on every push and pull request.

Valorant Agent Guide Live demo **09/2026**

- Built a responsive VALORANT agent guide with role filtering and map-specific picks for Lotus, Ascent, and Split, in HTML, CSS, and vanilla JavaScript on Netlify.

CodePath AI Engineering Projects PathReview code **Summer 2026**

- Implemented and debugged Python backend logic across four projects (Provenance Guard, Mixtape, Cinelog, PathReview): metadata scoring, playlist services, streak tracking, notifications, and watchlists.
- Isolated defects with pytest and mocked async SQLAlchemy sessions, so service logic could be tested without a live database; brought Cinelog to 10/10 tests passing and PathReview's FastAPI backend to 18/19.
- Reviewed teammates' code to catch logic errors and missed edge cases, then helped them debug failing tests.

VALORANT Content & Status Dashboard Live demo | Source code **05/2026**

- Built a responsive dashboard with vanilla JavaScript and Bootstrap 5, deployed on GitHub Pages, that displays agent, map, game-version, and North America server-status data from Riot's VALORANT Content and Platform Status APIs.
- Added per-map agent analytics (pick rate, ACS, ADR, K/D) from spike.gg stats, a best-maps lookup for each agent, and search, filtering, and A–Z/Z–A sorting for agents and maps.
- Tested the Content and Status endpoints in a Postman collection with two environments before integrating them; the public build serves saved API responses so the Riot API key never reaches the browser.

CERTIFICATIONS

CodePath: Applications of AI Engineering, Honors | Credential ID 422629 **Summer 2026**

New York Jobs CEO Council: Software Engineering Fellowship

DATACOM: Partnering with AI in the Workplace
